SAW HEAD ARBOR REMOVAL

To prevent damage to the motor during removal of arbor, please have a machine shop create a jig as follows.

Mount motor by passing blade threads through the outside of jig opening. Secure blade nut in plate. Use a bottle jack and then a dowel to push motor out of arbor.

Blade arbor is pressed in place with Red Loctite. Spray WD40 in set screw holes and apply heat to help with removal. Use Red Loctite in reassembly.

(19” LONG)   (10” WIDE w/ 2” OPENING)   (USE BOTTLE JACK)

DO NOT USE A HAMMER, IT WILL DAMAGE MOTOR
